LONG TIME AND GLOBAL SOLUTIONS FOR THE ONE-DIMENSION BOUSSINESQ-PEREGRINE SYSTEM FOR GENERAL AND SMALL BOTTOM VARIATION

LUC MOLINET[1] AND RAAFAT TALHOUK[2,3]

Abstract. The Boussinesq-Peregrine system is derived from the water waves system in presence of topographic variation under the hypothesis of shallowness and small amplitude regime. The system becomes significantly simpler under the hypothesis of small topographic variation. In this talk we discuss the long time and global well-posedness of the Boussinesq-Peregrine system. First, We present results concerning the long time well-posedness and the continuity of the associated flow map in the case of general topography (i.e. the amplitude of the bottom graph $\beta = O(1)$). The novelty lies in the Sobolov regularity order H^s, $s > \frac{1}{2}$. Second, We explain how the results obtained for the Bousinessq system in [1] still valid for the Boussinesq-Peregrine system under the hypothesis of small amplitude bottom variation (i.e. $\beta = O(\mu)$). More precisely, we obtain that the system admits unconditional unique global solution in the Sobolev spaces of type $H^s(\mathbb{R})$, $s > \frac{1}{2}$, as well as the propriety of continuity of the associated flow map. Third, (if time permits)) we give the existence result of a weak global solution in the Schonbek sense [2], i.e. existence of low regularity entropic solutions of the small bottom amplitude Boussinesq-Peregrine equations emanating from $u_0 \in H^1$ and ζ_0 in an Orlicz class as weak limits of regular solutions.
